Marks	1.00/1.00
Grade	**10.00** out of 10.00 (**100**%)

Question 1 | Correct Mark 1.00 out of 1.00

Convert the following algorithm into a program and find its time

complexity using counter method.

```
void function(int n)
{
    int c= 0;
    for(int i=n/2; i<n; i++)
        for(int j=1; j<n; j = 2 * j)
            for(int k=1; k<n; k = k * 2)
                c++;
}
```

Note: No need of counter increment for declarations and scanf() and count variable printf() statements.

Input:

A positive Integer n

Output:

Print the value of the counter variable

Answer:

```c
#include <stdio.h>

void function(int n) {
    int count = 0;

    for (int i = n / 2; i < n; i++) {
        count++; // Count for loop condition check (i < n)

        for (int j = 1; j < n; j = 2 * j) {
            count++; // Count for loop condition check (j < n)

            for (int k = 1; k < n; k = k * 2) {
                count++; // Count for loop condition check (k < n)
                count++; // Count for operation (c++)
            }
            count++; // Count for final false check of k loop
        }
        count++; // Count for final false check of j loop
    }
    count++; // Count for final false check of i loop

    printf("%d", count+1);
}

int main() {
    int n;
    scanf("%d", &n);
    function(n);
    return 0;
}
```

	Input	Expected	Got	
✔	4	30	30	✔
✔	10	212	212	✔

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.
